

Smart Contract Audit

UsersNetworkRouter

2022.4.29

1. Background

The purpose of the audit was to achieve the following:

- Ensure that the smart contract functions as intended.
- Identify potential security issues with the smart contract.

The information in this report should be used to understand the risk exposure of the smart contract, and as a guide to improve the security posture of the smart contract by remediating the issues that were identified.

2. Project Information

- Platform: Oasis (Emerald) network
- Contract Address: 0x1eaC6c4435DC92c223825F9e023ad6d3510e2CA9
- Code:

<https://explorer.emerald.oasis.dev/address/0x1eaC6c4435DC92c223825F9e023ad6d3510e2CA9/contracts>

3. Executive Summary

According to our assessment, the customer's solidity smart contract is **Secure**.

Automated checks are with remix IDE & hardhat. All issues were performed by me, which included the analysis of code functionality, manual audit found during automated analysis were manually reviewed and applicable vulnerabilities are presented in the audit overview section. The general overview is presented in the Project Information section and all issues found are located in the contract audit findings section.

I have found some very-low level issues in all solidity files of the contract

File in Scope:

- Contract: Router Contract
- Inherit: IUsersNetworkRouter02
- Observation: All passed including security check
- Test Report: passed
- Score: passed
- Unit Testing: 4 passed, 1 Failed
- Conclusion: passed

Issue Checking Status

No.	Issue Description	Checking Status
1	Compiler Warning	✓
2	Race conditions and Reentrancy. Cross-function race conditions.	✓
3	Possible delays in data delivery.	✓
4	Oracle calls.	✓
5	Design Logic.	✓

6	Timestamp dependence.	✓
7	Integer Overflow and Underflow.	✓
8	DoS with Revert.	✓
9	DoS with block gas limit.	✓
10	Methods execution permissions.	✓
11	The impact of the exchange rate on the logic.	✓
12	Private user data leaks.	✓
13	Malicious Event log.	✓
14	Scoping and Declarations.	✓
15	Uninitialized storage pointers.	✓
16	Arithmetic accuracy.	✓

4. Contract Audit Findings

Critical: No Critical severity vulnerabilities were found.

High: No High severity vulnerabilities were found.

Medium: No Medium severity vulnerabilities were found

Low: There were some low issues

✓ Solidity Static Analysis

- Security

No.	Issue Position(row)	Issue Description
1	402:28	"block.timestamp" can be influenced by miners to a certain degree. That means that a miner can "choose" the block.timestamp, to a certain degree, to change the outcome of a transaction in the mined block.
2	Check-effects-interaction	INTERNAL ERROR in module Check-effects-interaction: Cannot read properties of undefined (reading 'name')
3	9:44	Use of "call": should be avoided whenever possible. It can lead to unexpected behavior if return value is not handled properly. Please use Direct Calls via specifying the called contract's interface.
4	15:44	//

5	21:44	//
6	26:26	//

- Gas & Economy

No.	Issue Position(row)	Issue Description
1	307:4	If the gas requirement of a function is higher than the block gas limit, it cannot be executed. Please avoid loops in your functions or actions that modify large areas of storage (this includes clearing or copying arrays in storage)
2	314:4	//
3	324:4	//
4	398:4	//
5	399:4	//
6	444:4	//
7	460:4	//
8	486:4	//
9	503:4	//
10	524:4	//
11	337:8	Loops that do not have a fixed number of iterations, for example, loops that depend on storage values, have to be used carefully. Due to the block gas limit, transactions can only consume a certain amount of gas. The number of iterations in a loop can grow beyond the block gas limit which can cause the complete contract to be stalled at a certain point. Additionally, using unbounded loops incurs in a lot of avoidable gas costs. Carefully test how many items at maximum you can pass to such functions to make it successful.
12	596:8	//
13	601:25	//
14	705:8	//

- Miscellaneous

* Found bunch of similar variable names in Factory contract

* Constant/View/Pure functions:

INTERNAL ERROR in module Constant/View/Pure functions: Cannot read properties of undefined (reading 'name')* "bytes" and "string" lengths are not the same since strings are assumed to be UTF-8 encoded (according to the ABI definition) therefore one character is not necessarily encoded in one byte of data.

* Division of integer values yields an integer value again. That means e.g. $10 / 100 = 0$ instead of 0.1 since the result is an integer again. This does not hold for division of (only) literal values since those yield rational constants. (212:26,310:18, 320:20, 329:20)

- Multiple Pragma Statement

There are multiple pragma statements in the code. Only the compiler version 0.6.6 will

work with the code,
but keeping only one pragma statement helps in maintaining readability of the code.

✓ Solidity Unit Testing

✓ tests/router_test.sol

Progress: 1 finished (of 1)

FAIL testSuite (tests/router_test.sol)

✓ Before all

✖

✓ Check success

✖

✓ Check success2

✖

✖ Check failure

✖

Error Message:
"1 should not be equal to 1"

Assertion:
Expected value should be **notEqual** to 1

Received value:
1

Skipping the remaining tests of the function.

✓ Check sender and value

✖

Result for tests/router_test.sol
Passed: 4
Failed: 1
Time Taken: 0.38s

▼ Security

☒ Select Security

☒ Transaction origin:
'tx.origin' used

☒ Check-effects-interaction:
Potential reentrancy bugs

☒ Inline assembly:
Inline assembly used

☒ Block timestamp:
Can be influenced by miners

☒ Low level calls:
Should only be used by experienced devs

☒ Block hash:
Can be influenced by miners

☒ Selfdestruct:
Contracts using destructed contract can be broken

▼ Gas & Economy

☒ Select Gas & Economy

☒ Gas costs:
Too high gas requirement of functions

☒ This on local calls:
Invocation of local functions via 'this'

☒ Delete dynamic array:
Use require/assert to ensure complete deletion

☒ For loop over dynamic array:
Iterations depend on dynamic array's size

☒ Ether transfer in loop:
Transferring Ether in a for/while/do-while loop

5. Conclusion

The contracts are written systematically. There is no critical, high, middle severity issue. Since possible test cases can be unlimited, for such an extensive smart contract protocol, I have provided no such guarantee of future outcomes.

I have checked code line by line, and I have used all the latest static tools and manual observations to cover maximum possible test cases to scan everything.

Security state of the reviewed contract is “Secure”.

✓ No volatile code.

✓ No critical or high severity issues were found.
